

Scafftag Nanotag™ Inspection Tagging System

Product Images

Description

NANOTAG™ is a safety management tagging system, purpose designed for the identification and qualification of industrial equipment which has minimal attachment space such as eyebolts and shackles, hoses and cables, breathing apparatus and small portable tools

- Whilst designed to fit to the smallest of industrial applications, Nanotag™ still utilises the dynamic holder and inserts system, with the same principles as the rest of the Scafftag® range, delivering up-to-date inspection information
- Nanotag™ provides total flexibility with the options for cable tie, ring, rivet and screw attachment all accommodated within one system
- The system provides maximum visibility at the point of use, is weatherproof, UV protected, and durable to withstand the toughest industrial environments
- Three step system:
 1. Holder is permanently attached to equipment in a prominent position.
 2. Statutory inspection is carried out before use by authorised personnel and recorded on insert. The insert is placed in holder indicating equipment is READY FOR USE.
 3. If equipment fails inspection, insert is removed and handed over to appointed individual. The international "DO NOT USE" symbol is instantly displayed.

- System comes with a pack of 20 holders, 40 cable ties (150mm), and a permanent marker pen
- Inserts available separately for test, inspection and safe working loads
